hafiz-muhammad-wahaj-khan

Computer Engineering student at NUST with a strong foundation in machine learning, programming, and digital systems. Experienced in supervised learning concepts and practical implementation using Python, with additional exposure to data analysis and database-driven software development. Completed academic and self-driven projects in computer architecture and backend systems, demonstrating problem-solving ability and systems thinking.

Skills

- Python, C / C++
- Verilog HDL
- Machine Learning
- NumPy
- Pandas
- Matplotlib
- Scikit-learn
- Digital Logic Design
- Arduino Programming (basic)
- Proteus, ModelSim

Certifications

Google AI Professional Certificate

Supervised Machine Learning
(DeepLearning.AI)

Google Data Analytics (Python)

Education

Bachelor of Science in Computer Engineering

National University of Science And Technology, H-12, Islamabad — Expected in June 2029

- 3.42 GPA
- Completed Coursework: Programming Fundamentals, OOP, Digital Logic Design, Calculus, Linear Algebra.

FSC in Pre-Engineering

Govt Degree Science And Commerce College Malir Cantt, Karachi — May 2025

- 81% Grade

Experience

Independent Machine Learning Research

Under Dr. Ahmed Naeem, NUST — May 2026 - June 2026

- Worked on supervised machine learning concepts including regression and classification.
- Studied model evaluation, overfitting, and training workflow using Python.
- Applied statistical learning and probabilistic modeling towards modern AI techniques.

Projects

8-Bit Computer (Verilog / SAP-1 Architecture)

- Designed and implemented an 8-bit SAP-1 computer architecture utilizing Verilog HDL and digital logic components.
- Built the ALU, control unit, registers, and memory system.
- Simulated processor instruction cycles (e.g., ADD) and verified hardware timing execution using ModelSim and Proteus.

Parking Management System (Digital Logic Design)

- Designed a hardware-based logic system to monitor and manage parking space availability.
- Implemented combinatorial and sequential logic circuits using logic gates, flip-flops, and counters.
- Simulated circuit behavior and verified correct state transitions using Proteus.

Inventory Management System (Python, MySQL)

- Developed a database-driven inventory management system using Python and MySQL.
- Implemented CRUD operations with MySQL database integration for persistent storage and relational schema design.
